

ABSTRACT

Market data, such as order information, is displayed in relation to a derivative of price. A derivative of price refers to anything that bears some relationship to price, examples of which, include net change, yield, profit and loss, volatility, momentum
5 indicators, and more. According to various aspects of the preferred embodiments, market data is received from one or more electronic exchanges and a value axis is generated based on a user's preferences. Then, market data can be displayed in relation to the value axis to provide a user interface that allows a trader to view the market from a more desirable perspective.
